Tutorial and Lab Sheet 4 ASP.NET Core MVC Code First

Exercise 1 Code First approach

Today you will create the first ASP.NET Core MVC web application using *code first* approach.

Ask your tutor about the following:

- What is difference between *Code First* and *Database First* approaches?
- What is *Entity Framework (EF)*?
- What is LINQ to Entities?

After your tutor has explained all the above, please complete the following tutorial:

<https://learn.microsoft.com/en-au/aspnet/core/tutorials/first-mvc-app/start-mvc?tabs=visual-studio&view=aspnetcore-10.0>

Complete the following parts of the tutorials:

Add a controller

Add a view

Add a model

Work with a database

Controller actions and views

Instead of using LocalDB SQL Server, use the one on Cloud for which you have been given accounts i.e.:

rmit.australiaeast.cloudapp.azure.com

If you don't know how to use it in context of this tutorial, ask your lab-assistant.

Please read the note on next page →

Exercise 2 Validation

Complete the following parts from the MSDN tutorial:

Add a controller

Add a view

Add a model

Work with a database

Controller actions and views

Add search

Add a new field

Add validation

Don't take these MSDN tutorial exercises lightly; these are very important and handy for understanding and learning purposes. Please do not ignore these MSDN tutorials just because the tutorial sheet references them.

Exercise 3 Getting familiar with Razor syntax (**Self-Exercise**)

You will need to be good at Razor syntax, make sure you do a thorough reading of this document:

<https://learn.microsoft.com/en-au/aspnet/core/mvc/views/razor?view=aspnetcore-10.0>

You will often need to customise views to meet/suit the requirements, as such you need to know Razor syntax!
